

#### **Arbitrary Waveform Generator/Transceiver**

The Proteus Arbitrary Waveform Generator (AWG) is ideal for applications in Quantum Computing, Electronic Warfare, Radar, and next generation communications such as 5G, 6G, Ultrawide Bandwidth (UWB), Wi-Fi 6, 7, and more. Built on the latest RF DAC and RF ADC technology, this versatile product platform has sample rates up to 9GS/s that allows for multiple Nyquist zone operation providing frequency ranges more than 10GHz. It has an innovative hardware based (FPGA) task oriented programming and signal processing environment. When used in combination with its optional RF Digitizer it becomes an Arbitrary Waveform Transceiver (AWT) giving you the ability to change waveforms in real-time; making it ideal for improving the coherence time of a Qubit, characterizing an RF amplifier, or responding to an EW (Electronic Warfare) threat.

#### Modular Scalable Architecture

Proteus is a modular design based on the industry standard PXIe format. Each module can be configured to have up to four RF/ $\mu$ W differential outputs and two digitizer inputs. Hardware based user programming is facilitated by the easy-to-use FPGA based DSP programming system, large waveforms and acquisitions can use its large 16GS onboard memory and fast data transceiver is facilitated through its PCIe Gen 3 x 8 interface.

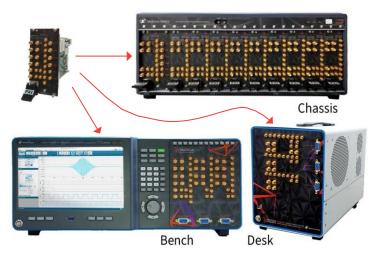

## **Multiple Formfactors**

Infinite possibilities

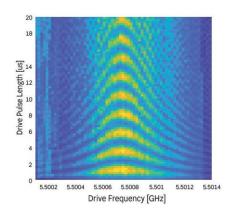

For high density applications such as a high Qubit count Quantum Computers, Massive MIMO or phased array Radar and Electronic Warfare Systems the PXIe Chassis system allows you to scale. It is compatible with the industry standard PXIe modular architecture, providing custom systems capability alongside other PXIe compatible instrumentation such as the Tabor A10200 20GHz Amplifier.

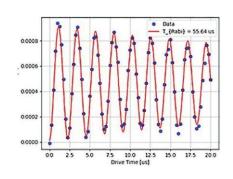

The benchtop version of the Proteus series offers up to 12 channels in a 4U, 19" box. With a 9" touch display and on-board PC that can run Tabor, Python and MATLAB applications. The desktop is identical to the bench, but has the screen and keyboard omitted.

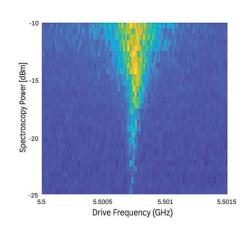

#### **Applications**

**Quantum Physics** - Proteus plays a part in many Quantum Physics Experiments. Its unique AWT architecture allows for the generation and analysis of pulses in real time, with fast measurement response and feedback provided with its FPGA based decision block architecture. Applications include NMR/EPR, Device Characterization, Computing, Communications and Sensing. With direct to RF/ $\mu$ W capability it eliminates the need of cumbersome up/down converting units and requires no IQ alignments. It can be scaled to 1000s of coherent channels, and its advanced signal processing engine has the capability of analyzing up to 10 frequency multiplexed readout lines.

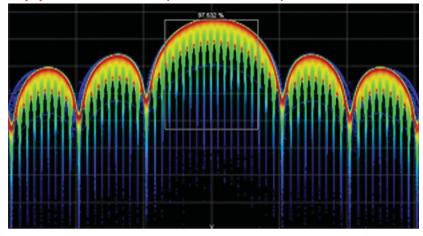

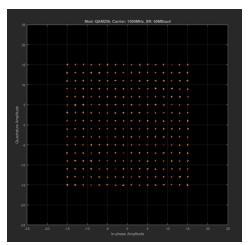

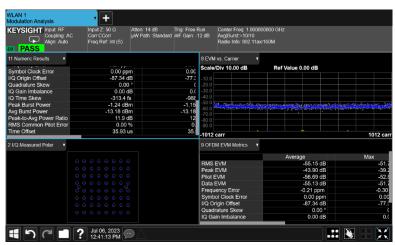

### Applications - (continued)

Radar and Electronic Warfare - Proteus is an ideal tool for real time waveform generation and analysis up to and including X-Band. The transceiver allows for real-time closed loop analysis for fast feedback systems such as Radar Target Generation and Adaptive Electronic Warfare Systems. The scalable multi-channel, coherent, deterministic waveform playout capability, allows for the generation of multiple active emitters, while its 2GHz of Bandwidth allows for easy creation of background electromagnetic emissions.

Next Generation Wireless Communications Systems – When designing, developing and manufacturing new wireless systems based on technologies such as Multiple In and Multiple Out (MIMO) antenna matrices and Orthogonal Frequency Division Multiplex (OFDM) modulation, Proteus is built on a scalable wide bandwidth (2GHz) architecture, high performance RF DAC/ADC (EVM better than -50dBc) that is compatible with MATLAB. Allowing you to create, model, then transfer waveforms or sequencies of waveforms to Proteus for real world test.

**Generate any Imaginable Scenario** - Proteus has an innovative hardware-based task-oriented programming system for complex waveform sequences. You can generate and download waveforms simultaneously, stream data directly to the FPGA (by-passing the memory) at speeds of up to 4GS/s, a full and easy to program digital subsystem of digital up and down converters, finite impulse response filters, FFT and multiple real time averaging blocks. This makes the Proteus AWT the most comprehensive measurement solutions available.
