

PROTEUS

Infinite possibilities

Desktop Platform

Introducing Tabor's all new Proteus series, the world's first Arbitrary Waveform Transceiver. In a compact desktop platform, the system integrates the ability to transmit, receive and perform digital signal processing all in a single instrument. The small footprint system, that can generate up to 12 channels in a single box, offers industry leading performance, various configuration options, an innovative task oriented programming, and user programmable FPGA. So whether it is for high-end aerospace and defense, telecommunications, automotive, medical or physics applications Proteus opens the door to a world of infinite possibilities.

Leading Features:

Dual, four, eight or twelve channel 1.25GS/s & 2.5 GS/s 16 bit, or dual, four or six channel 9GS/s 8 bit, AWG & AWT configurations

Integrated NCO for digital up-converting to microwave frequencies

Real time data streaming directly to the FPGA for continuous and infinite waveform generation

8GHz Bandwidth, 5.4GS/s 12 bit digitizer option for feedback control system and conditional waveform generation

Innovative task oriented sequence programming for maximum flexibility to generate any imaginable scenario

Up to 16GS waveform memory with the ability to simultaneously generate and download waveforms.

Excellent phase noise and spurious performance

User Customizable Digital Signal Processing block for real time processing and application specific functionality

Space efficient desktop platform, with USB 3.0, 10G Ethernet and Thunderbolt high speed interfaces.

Compact and space efficient

The desktop version of the Proteus series offers up to 12 channels in a 4U, half 19" dedicated chassis. The compact form size and small footprint saves valuable bench space. So for synchronized, phase coherent, multi-channel applications such as quantum physics and radar applications the Proteus arbitrary waveform transceiver is an ideal, space efficient and cost effective solution.

Extra-fast communication interface

Spending more time setting up your generated scenario than actually running it? The Proteus desktop platform offers the fastest standardized communication interfaces commonly available in PCs today. These include USB3.0 and 10GE interfaces as well as, a thunderbolt 3 interface which enables up to 40Gb/s of data transfer speed. These enable the user to easily connect to the Proteus arbitrary waveform transceiver and still offer some of the fastest waveform download available on the market today, saving you one of your most valuable resources, time.

Feedback control system

Many of today's applications, require conditional waveform generation depending on input signals from the environment. The Proteus arbitrary waveform transceiver flawlessly integrates both DAC and ADC in one system, controlled by a single FPGA for optimal synchronization and minimum latency. This high speed control system provides a feedback loop for fast decision making on the fly with minimum latency.

Generate any imaginable scenario

The new series offers an innovative task oriented sequence programming where user can change the full instrument set up at every line of the task table. In addition, not only can users of the Proteus series instruments generate and download waveforms simultaneously, they can stream data directly to the FPGA without the need to use the built in memory. This enables generating random, unique and infinitely long scenarios directly from the controlling PC at DAC speeds of up to 6GS/s. So no matter whether your scenario is extremely complex, infinite or even dynamic you can generate it with the Proteus series model.
